

# NetForum's Advanced Threat Detection and Fraud Prevention

Websites are constantly exploited by malicious actors for vulnerabilities. Hackers create bots and use standard processes to harm others or degrade a system's performance. Technology is constantly changing, and security is getting more complex with machine learning, bots, and Robotic Process Automation (RPA).

How can you guard your organization's data against these evolving security risks? NetForum's Advanced Threat Detection and Fraud Prevention service uses an intelligent and specialized web monitoring tool to protect your AMS against fake accounts, scraping, account takeover, card cracking, and server overload BEFORE it even gets to your AMS.

Real-time protection against bots, fraud, and denial of service

Minimal friction – quick, flexible, fully managed

Increased visibility – see logs, source, type

*"The threat detection service has made a big difference. We can now see what is being blocked for us and the number of times the same IP is coming up with fraud detection. It has been really helpful."*
